Executive Positioning

Noetfield is a pre-execution governance infrastructure that enables regulated organizations to simulate, evaluate, and audit AI-driven operational decisions before deployment.

Problem Statement

Canadian regulated organizations are rapidly adopting AI systems without pre-execution validation, audit-grade decision traceability, policy enforcement before system actions, or regulatory-ready evidence generation.

- Compliance risk (AI Act and emerging AI governance rules)

- Operational

Solution: Governance Execution Layer (GEL)

- Intent evaluation before execution (ALLOW / REJECT / REVIEW)

- Immutable

Innovation - Why This Warrants Public Support

This project introduces structural separation of execution vs governance. Noetfield NEVER executes financial or operational actions. It ONLY evaluates, simulates, and logs decision outcomes while producing audit-ready compliance evidence.

Strategic Value to Canada

- AI governance infrastructure aligned with emerging regulatory frameworks

- Reduce

Internal Appendix - Build Status vs Narrative

Use external narrative for IRAP and partner conversations. This appendix maps claims to current engineering reality in NOETFELD OS.

Capability	External claim	Current build	Target (pilot)
Decision engine	ALLOW/REJECT/REVIEW	Working (FastAPI)	Production hardened
Policy layer	Golden Edge v3	JSON policy loader	Versioned tenant policies
Audit ledger	Postgres-backed	SQLite audit_log	Postgres migration
Console	Simulation UI	API + /portal/audits	Full simulation console
Non-custodial	No execution	Decision-only API	Contract + docs aligned

IRAP Messaging Guardrails

- Lead with governance infrastructure, not lending or payments.
